

Marine Rescue WA Communications Guide

Showing locations of Marine Rescue Groups and Marine VHF Repeater Range Arcs

Please note: Repeaters have a Nominal Range of 60 Nm except for Abrolhos - Rat Island (30 Nm)

Warning
Distances of VHF radio communications vary greatly due to such factors as geographic location, antenna height above water and equipment used.
As such the ranges depicted are nominal and should not be considered as reliable.
Repeaters simply extend the communication range for a vessel, allowing it to be heard by any other vessels or coast stations within the range of the repeater, but may not be monitored at all times.
Prior to their departure, mariners are encouraged to contact the coast station in the area to determine the extent of coverage for their voyage and the monitoring hours of the coast station.
